3. Negative findings — what was ruled out
4. Containment and eradication performed
5. Recommended actions
6. Plain-language glossary

What happened

An intruder reached ten hosts using one implant and one command-and-control address, moving between machines with a shared administrative credential. A separate cryptomining installation on two other machines is unrelated to it.

Case metadata

Field	Value
Case	Investigation INC-CORPUS-A
Incident id	INC-CORPUS-A
Status	open
Severity	unspecified
Opened	2026-08-13 01:29:32Z
Concluded	—
Hosts examined	20
Collection runs	20
Data as of	2026-08-13 01:39:27Z

All times are UTC. Timestamps are recorded by the platform in UTC and are rendered here unchanged; a reader working in another zone must convert.

Negative findings — what was ruled out

Removable media was the entry point — ruled out by uat-life-examiner on 2026-08-13 01:38:02Z.

- How it was tested: Every USB device recorded on the affected hosts was enumerated and compared against the first evidence of compromise on each.
- Why the conclusion holds: No device predates the earliest implant, so none can be the source.
- Rests on: run:461

Containment and eradication performed

- 2026-08-13 01:38:02Z — Blocked the C2 address at the perimeter (uat-life-collector)

Recommended actions

1. **Rotate the shared administrative credential** — It was used on every affected host and must be considered exposed.

Plain-language glossary

No glossary terms are curated on this deployment.

This is a plain-language summary. The full technical analysis, evidence inventory and exact indicators are in the technical report for this case. All times are UTC.
